The thermal break, explained.

What sits inside an aluminum frame, and why it keeps the room warm.

Inside the frame

Two shells, one insulating core.

/01 Outer aluminum shell, facing the weather

/02 Polyamide thermal break, the insulating core

/03 Inner aluminum shell, facing the room

/04 Less heat loss, less condensation

Ask the question

Is the frame thermally broken?

It is the first question to ask about any aluminum window. Without a thermal break, the frame conducts cold straight inside.

Full guide on our website. Including what to ask before you specify.
