

The thermal break, explained.

What sits inside an aluminium frame, and why it keeps the room warm.

Inside the frame

Two shells, one insulating core.

- /01 Outer aluminium shell, facing the weather
- /02 Polyamide thermal break, the insulating core
- /03 Inner aluminium shell, facing the room
- /04 Less heat loss, less condensation

Ask the question

Is the frame thermally broken?

It is the first question to ask about any aluminium window. Without a thermal break, the frame conducts cold straight inside.
