

The thermal break, explained.

What sits inside an aluminium frame, and why it keeps the room warm.

Inside the frame

Two shells, one insulating core.

/01 Outer aluminium shell, facing the weather

/02 Polyamide thermal break, the insulating core

/03 Inner aluminium shell, facing the room

/04 Less heat loss, less condensation

Ask the question

Is the frame thermally broken?

It is the first question to ask about any aluminium window. Without a thermal break, the frame conducts cold straight inside.
